

1A, 0.25V Feedback Voltage Step-Down Switching Regulators for LED Driver

❖ GENERAL DESCRIPTION

AX2001/A consists of step-down switching regulator with PWM control. These devise include a reference voltage source, oscillation circuit, error amplifier, internal PMOS and etc.

AX2001/A provides low-ripple power, high efficiency, and excellent transient characteristics. The PWM control circuit is able to the duty ratio linearly from 0 up to 100%. An enable function, an over current protect function and short circuit protect function are built inside, and when OCP or SCP happens, the operation frequency will be reduced. Also, an internal compensation block is built in to minimum external component count.

With the addition of an internal P-channel Power MOS, a coil, capacitors, and a diode connected externally, these ICs can function as step-down switching regulators. They serve as ideal power supply units for portable devices when coupled with the SOP-8L package, providing such outstanding features as low current consumption. Since this converter can accommodate an input voltage up to 23V, it is also suitable for the operation via an AC adapter.

❖ Function Descriptions

PWM Control

The AX2001/A consists of DC/DC converters that employ a pulse-width modulation (PWM) system. In converters of the AX2001/A, the pulse width varies in a range from 0 to 100%, according to the load current. The ripple voltage produced by the switching can easily be removed through a filter because the switching frequency remains constant. Therefore, these converters provide a low-ripple power over broad ranges of input voltage and load current.

Setting the I_{LED} Current

Application circuit item shows the basic application circuit with AX2001/A adjustable output version. The external resistor sets the LED output current according to the following equation:

$$I_{LED} = \left(\frac{0.25V}{R2} \right)$$

Table 1 Resistor select for LED output current setting

I _{LED}	R2	
350mA	0.715Ω	87.5mW
750mA	0.333Ω	189mW

RDS(ON) Current Limiting

The current limit threshold is setting by the internal circuit.

Compensation

Please refer the table of application circuit. For DC input, the option circuit for compensation is connecting R4 and a 4148 diode to Vout. In order to protect short circuit and thermal shutdown release for LED.

PCB layout guide

If you need low T_c & T_j or large PD (Power Dissipation), the dual SW pins (5&6) on the SOP-8L package are internally connected to die pad. The PCB layout should allow for maximum possible copper area at the SW pins of the AX2001/A.
